

I was diagnosed with Parkinson's the spring of 2014. My conditions were not getting better and by May of 2015 after doing extensive researches I decided to do stem cell treatment. There are a lot of clinics outside the US and just across the border. I decided that I wanted treatment in the US using adipose tissue, even though my research indicated that the best results were coming from fetal or Placentia stem cells not performed in the US.

I used the clinic that I determined had the best answers to my questions. Since my treatment my conditions have improved and the amount of medication I use has gone down. While the treatment was not inexpensive it was within my reach.

I think the government's role in stem cell treatment should be to see that the clinics that perform this treatment are using the best medical science available. Not regulating the procedure out of the reach of the general public.

If the government does what it usually does it will drive this cutting edge treatment to go out of the country and only available to the rich. I pray that no one you know gets this condition but I assure you that if someone you do know gets it you will want them to receive this treatment at an acceptable cost. The Pharmaceutical companies are not interested in finding a cure they are looking for a treatment regime that will require a person to take medicine to help control the effects of Parkinson's. They would like to put a stop to the treatment that offers a promise of curing the ailment in the future.
