

Henry E. Young PhD, Chief Science Officer, Dragonfly Foundation for Research & Development, a 501(c)3 non-profit entity. I have spent my entire 40+ year (academic and foundation) research career characterizing precursor (stem and progenitor) cells within organs and tissues in salamanders, avians, and 11 species of mammals, including humans. From these studies I have learned some attributes of precursor cells (see attached Table), their respective differentiation potentials (see attached Developmental Flow Chart), and methods to isolate these cells (see attached Isolation flow charts) without a change in either their respective cellular attributes or differentiation potentials. I would like to address the HCT/P concerns of the FDA committee with respect to homologous use and minimal manipulative procedures with definitions, examples, flow charts, and a table.
